

REAL FRAUD CASE STUDIES

◆ 1. High-Value Rapid Transfer Fraud

Scenario:

A customer account suddenly initiated 5 transactions within 2 minutes, each above ₹90,000.

Observation:

- Transactions occurred late night (2:30 AM)
- New beneficiary added just before transfers
- No prior history of high-value transfers

Detection Rule Triggered:

- Velocity Rule
- High Amount Rule
- New Beneficiary Rule

System Action:

- Marked as ALERT initially
- Escalated to FRAUD after pattern confirmation
- Account temporarily blocked

Analyst Action:

- Contacted customer → confirmed unauthorized
- Reversed transactions where possible

Conclusion:

Rapid high-value transfers are strong indicators of fraud.

◆ 2. Account Takeover (ATO) Case

Scenario:

User login detected from a new device in a different city followed by fund transfer.

Observation:

- Login from Mumbai (user usually in Pune)
- Device fingerprint mismatch
- Immediate transfer after login

Detection Rule Triggered:

- Geolocation anomaly
- Device mismatch
- Suspicious behavior pattern

System Action:

- Marked as FRAUD
- Session terminated
- Account locked

Analyst Action:

- Reset credentials
- Advised customer on phishing risks

Conclusion:

ATO attacks often involve sudden location + device changes.

◆ 3. Repeated Failed Transaction Fraud

Scenario:

Multiple failed transactions followed by one successful high-value transfer.

Observation:

- 8 failed attempts within 1 minute
- Followed by successful ₹1,50,000 transfer
- Same beneficiary

Detection Rule Triggered:

- Failed attempt threshold
- Suspicious retry pattern

System Action:

- Flagged as ALERT → escalated to FRAUD

Conclusion:

Repeated failures often indicate brute-force or OTP compromise.

◆ 4. Round Amount Fraud Pattern

Scenario:

Transactions repeatedly in round figures like ₹50,000, ₹1,00,000.

Observation:

- No variation in amounts
- Multiple recipients
- Unusual for user profile

Detection Rule Triggered:

- Pattern anomaly
- Behavioral deviation

Conclusion:

Fraudsters often use round figures for quick transfers.

◆ 5. Cross-Border Fraud Case

Scenario:

Transaction initiated from India followed by login from foreign IP within minutes.

Observation:

- Impossible travel scenario
- IP mismatch
- High-risk country

Detection Rule Triggered:

- Geolocation anomaly
- Risk-based country check

Conclusion:

Cross-border anomalies indicate compromised accounts.

◆ 6. Phishing-Based Fraud Case

Scenario:

User shared OTP unknowingly, followed by unauthorized transfer.

Observation:

- Normal login behavior
- Sudden high-value transaction
- No prior suspicious activity

Detection Rule Triggered:

- High amount
- Behavioral deviation

Conclusion:

Phishing bypasses traditional checks → needs behavioral detection.

◆ 7. Mule Account Fraud

Scenario:

Funds transferred through multiple intermediate accounts.

Observation:

- Rapid chain transactions
- Same amount across accounts
- No withdrawals

Detection Rule Triggered:

- Transaction chaining
- Pattern similarity

Conclusion:

Used for money laundering.

◆ 8. Dormant Account Fraud

Scenario:

Inactive account suddenly used for transactions.

Observation:

- No activity for 6 months
- Sudden ₹80,000 transfer

Detection Rule Triggered:

- Dormant account activation

Conclusion:

Dormant accounts are high-risk targets.
