

Fraud Monitoring Rules for Digital Payment Systems

Rule R101 – High Value Transaction Monitoring

Transactions exceeding USD 10,000 or equivalent in a single operation must trigger a fraud monitoring alert. Such transactions require additional verification through customer authentication or manual review.

Rule R102 – Geolocation Anomaly Detection

If two transactions occur within a short time window from geographically distant locations, the system should flag the activity for potential account takeover investigation.

Rule R103 – Suspicious Merchant Detection

Transactions involving merchants classified as high risk (e.g., gambling platforms, cryptocurrency exchanges, or unverified merchants) must be marked for enhanced fraud review.

Rule R104 – Velocity Check

Multiple transactions executed within a short time interval from the same account should trigger velocity-based fraud detection rules.

Rule R105 – First-Time Merchant Transaction

Transactions with merchants not previously used by the customer may require additional monitoring, particularly when transaction amounts exceed typical spending behavior.
